Quick answer

Your internet service provider may not be delivering the speed that they promised to you when you signed up for the service. This ring a bell to you?

Your internet service provider may not be delivering the speed that they promised to you when you signed up for the service. This ring a bell to you? According to Ookla, a company that owns speedtest.net, many users in the United States do not receive their desired internet speed. To enjoy the benefits of the internet, you need to get your internet connection from a company that is reliable and known for its quality service.

It is quite possible that the speed test results differ when you use different calculators. The lowest speed reported by Flash-Based Test, a speed calculator, is 783 Kbps for a 15 Mbps internet plan, which is a lot slower than the speed promised by the internet service provider.

In another test, with the same service used, the reading showed a speed of 11.237 Mbps. The highest internet speed reported was 13.06 Mbps, calculated by speedof.me. However, after just 2 days, we ran the same test on the same connection and this time the result generated a speed of 4.87 Mbps.

What Difference Do Speed Tests Make?

According to some experts, HTML5 based tests such as speedof.me are more authentic and accurate than many other speed tests, especially the ones that use Adobe Flash and Java. Some experts also believe that multithread tests do not take into account the real-world network traffic and therefore, are not that accurate. So, always ensure the authenticity of the service before you test your connection.

Finding High-Speed Service Providers

You can surf the internet to find service providers who ensure that they deliver the speed you signed up for, initially. Search engines like Google, Bing, and Yahoo simplify the process of finding service providers by giving you an option of advanced search where you can easily type in the keyword and find the solution to your problem conveniently.

In addition to this, you can look for fast and reliable service providers in local newspaper ads because many service providers advertise through newspapers and magazines. Also, ask your neighbors about their service and the speed that they are receiving to gauge the types of services that are available in your area.

Online forums and discussions can prove to be very helpful in your search for service providers as people usually give reviews about their service providers, which means you can get a better idea about most ISPs.

To narrow down the search results, enter your zip code and street address on Local Cable Deals and the website will display all the providers that are available in your area. Once you have the list in front of you, you can easily compare the plans and prices of the internet companies and choose the one that perfectly blends with your requirements.

If you are looking to buy multiple services, then getting a bundle package from the same provider is always a good idea. This way you will be able to get a discounted deal, have just one accumulated bill to pay at the end of the month and save hundreds of dollars each year.

Speed Test Findings

Surprisingly enough, Spectrum is one of the most consistent speed providers in the U.S. The speed test was conducted by Ookla's speed test, which also takes into account real-time traffic and is considered reliable by most authorities.

After accumulating the speed test results from hundreds of service providers, it is safe to conclude that spectrum internet packages deliver some of the fast, steady, and most reliable speeds that you can expect to receive from your subscription.

Conclusion

The internet that you subscribe to should be able to connect all your family devices to the internet. Therefore, you should conduct proper research before you finalize your decision regarding an internet service provider because you might have to sign a long-term contract if you choose to go with anyone other than Spectrum.
